Quantum Codes

- Presentation Outline

- Introduction

- **Quantum Codes**

- Proposal

- Stabilizer Codes

- Known Toric Quantum Codes

- New Toric Quantum Codes

- Conclusions

- QUANTUM CODES:

The construction of quantum error-correcting codes (QEC) is strongly dependent on the properties of the classical linear codes.

Quantum Codes

- Presentation Outline

- Introduction

- Quantum Codes

- Proposal

- Stabilizer Codes

- Known Toric Quantum Codes

- New Toric Quantum Codes

- Conclusions

- QUANTUM CODES:

The construction of quantum error-correcting codes (QEC) is strongly dependent on the properties of the classical linear codes.

- A PARTICULAR APPROACH OF QUANTUM CODES:

The topological quantum error-correcting codes (TQC) make the quantum states to depend on topological properties of a physical system. This is a form of realizing fault-tolerant quantum computation, because topological properties are invariant under smooth degradations.

- QUANTUM CODES:

The construction of quantum error-correcting codes (QEC) is strongly dependent on the properties of the classical linear codes.

- A PARTICULAR APPROACH OF QUANTUM CODES:

The topological quantum error-correcting codes (TQC) make the quantum states to depend on topological properties of a physical system. This is a form of realizing fault-tolerant quantum computation, because topological properties are invariant under smooth degradations.

- TORIC CODES:

Kitaev proposes the class of *toric codes*, a subclass of the stabilizer quantum codes associated with the square lattice of torus \mathbb{Z}^2 .

Proposal

- Presentation Outline

- Introduction

- Quantum Codes

- Proposal

- Stabilizer Codes

- Known Toric Quantum Codes

- New Toric Quantum Codes

- Conclusions

- PROPOSAL:

It is possible to generate toric quantum codes by means of tessellations of square lattice of torus by translations of a determined fundamental region.

Stabilizer Codes

Stabilizer Codes

- Presentation Outline

- Introduction

- Stabilizer Codes

- Stabilizer Codes

- Stabilizer Codes

- Stabilizer Codes

- Known Toric Quantum Codes

- New Toric Quantum Codes

- Conclusions

- Pauli group of n qubits:

$$\mathcal{P}_n = \pm \{I, \sigma_x, \sigma_y, \sigma_z\}^{\otimes n}.$$

$$I \equiv \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}, \sigma_x \equiv \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}, \sigma_y \equiv \begin{bmatrix} 0 & -i \\ i & 0 \end{bmatrix}, \sigma_z \equiv \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}.$$

Stabilizer Codes

- Presentation Outline

- Introduction

- Stabilizer Codes

- Stabilizer Codes

- Stabilizer Codes

- Stabilizer Codes

- Known Toric Quantum Codes

- New Toric Quantum Codes

- Conclusions

- Pauli group of n qubits:

$$\mathcal{P}_n = \pm \{I, \sigma_x, \sigma_y, \sigma_z\}^{\otimes n}.$$

$$I \equiv \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}, \sigma_x \equiv \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}, \sigma_y \equiv \begin{bmatrix} 0 & -i \\ i & 0 \end{bmatrix}, \sigma_z \equiv \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}.$$

- Properties:

- For each $M \in \mathcal{P}_n$, we have $M^2 = \pm I$;
- If $M^2 = I$, then M is Hermitian; if $M^2 = -I$, then M is anti-Hermitian.
- $M, N \in \mathcal{P}_n \Rightarrow MN = NM$ or $MN = -NM$.

- Stabilizer Codes

Known Toric Quantum Codes

New Toric Quantum Codes

Conclusions

- Let \mathcal{S} be an Abelian subgroup of \mathcal{P}_n called *stabilizer group*.
- The elements of \mathcal{S} are called **stabilizer operators**.
- A stabilizer code $\mathcal{C}_S \subseteq \mathcal{H}$ associated to \mathcal{S} is the simultaneous eigenspace, with eigenvalue $+1$, comprising all elements of an Abelian subgroup \mathcal{S}

$$\mathcal{C}_S = \{|\psi\rangle; \quad M|\psi\rangle = |\psi\rangle \quad \forall M \in \mathcal{S}\}.$$

Stabilizer Codes

- $[[d^2 + 1, 2, d]]$ codes
- $[[2d^2, 2, d]]$ codes
- New Class of Toric Codes

- Conclusions

- The set of representatives of polyominoes, \mathcal{A} , corresponds to a classical lattice code.
- \mathcal{A} is a subgroup of $(\mathbb{Z}_m \times \mathbb{Z}_m, +)$.
- To get a polyomino with area m , the cardinality of \mathcal{A} must be m , $|\mathcal{A}| = m$.

- Conclusions

- The set of representatives of polyominoes, \mathcal{A} , corresponds to a classical lattice code.
- \mathcal{A} is a subgroup of $(\mathbb{Z}_m \times \mathbb{Z}_m, +)$.
- To get a polyomino with area m , the cardinality of \mathcal{A} must be m , $|\mathcal{A}| = m$.
- The quadratic form of the lattice $\mathbb{Z}_m \times \mathbb{Z}_m$ will be used to find the lattice vectors $(x, y) \in \mathcal{A}$

$$x^2 + y^2 = m.$$

- Since we wish that $|\mathcal{A}| = m$, we have:
 - $\gcd(x, y) = 1 \Rightarrow \mathcal{A} = \langle (x, y) \rangle$.
 - $\gcd(x, y) = \delta \neq 0, 1 \Rightarrow \mathcal{A} = \langle (x, y), (-y, x) \rangle$.

- $[[2d^2, 2, d]]$ codes
- New Class of Toric Codes

Conclusions

- Once the subspace given by the representatives is known, it is possible to choose the polyominoes that may tessellate the lattice.
- The quantum code associated to this tessellation is defined as:
 - $n =$ number of edges of the polyomino $= 2m$.
 - $k = 2$.
 - The minimum code distance is given by the shortest distance between two representatives of the polyominoes. Therefore

$$d = d_M = |x| + |y|,$$

where d_M is the *Mannhein distance*.

- $[[2m, 2, d_M]]$.

- Through an algebraic approach it is possible to use the concept of polyomino to generate toric quantum codes by means of tessellations of square lattice of torus by translations of this polyomino;
- The codes defined in this way keep the same properties of Kitaev's toric codes;
- Besides reproducing known classes of codes, new classes of toric codes are determined. For instance, the class $[[d^2, 2, d]]$, the best known so far.
