AweSums: The Majesty of Maths

We aim to get a flavour of the Riemann Hypothesis.

It involves the zeros of the "Zeta function":

$$\zeta(s) = \sum_{n=1}^{\infty} \frac{1}{n^s}$$

So, we need to talk about several new topics.

In this lecture, we will look at complex numbers.

Polynomials

Many functions can be approximated by polynomials.

What is a polynomial? A simple algebraic function, a combination of integral powers of the variable *x*.

Examples of polynomials:

Linear: 5x - 7Quadratic: $x^2 + 3x + 4$ Cubic: $x^3 + 3x^2 + 4x - 5$ *n*-th order: $a_0 + a_1x + a_2x^2 + \dots + a_nx^n$ Cubic with roots: 6(x - 3)(x - 5)(x + 2)

Ful Form

Polynomial Approximation. Taylor Series

Any "reasonable function" f(x) can usually be approximated by a simple polynomial function

$$p(x) = a_0 + a_1x + a_2x^2 + \cdots + a_nx^n$$

Sometimes we can find the roots of the polynomial; that is, the values of *x* for which it is zero.

Then we are able to write the polynomial as

$$p(x) = a_n(x - x_1)(x - x_2)(x - x_3) \cdots (x - x_n)$$

It is simple to sketch the graph of this function.

Taylor Series for Sine Wave

The Taylor series for sin x is

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \cdots$$

We truncate to get a sequence of polynomials:

$$p_{1}(x) = x$$

$$p_{3}(x) = x - \frac{x^{3}}{3!}$$

$$p_{5}(x) = x - \frac{x^{3}}{3!} + \frac{x^{5}}{5!}$$

$$p_{7}(x) = x - \frac{x^{3}}{3!} + \frac{x^{5}}{5!} - \frac{x^{7}}{7!}$$

They approximate sin x better with increasing order.

Approximations to Cosine Wave

The Exponential Function

We have defined the exponential function as

- The inverse of the logarithmic function
- ► The limit of the sequence *s_n* where

$$s_n = \left(1 + \frac{x}{n}\right)^n$$

as $n \longrightarrow \infty$

Taylor

Now we will define it by an infinite series.

Basel

Complex

(日)

Eul Form

Intro

The Binomial Expansion

If you have never heard of the binomial theorem please ignore this slide

If $s_n = (1 + x/n)^n$ is expanded using the binomial theorem, we get the following expression:

$$s_n = 1 + n\left(\frac{x}{n}\right) + \frac{n(n-1)}{2!}\left(\frac{x^2}{n^2}\right) + \frac{n(n-1)(n-2)}{3!}\left(\frac{x^3}{n^3}\right) + \dots + \left(\frac{x^n}{n!}\right)$$

Letting *n* become large, this tends to the series

$$s_n\approx 1+x+\frac{x^2}{2!}+\frac{x^3}{3!}+\cdots$$

Distraction 8: Sum by Inspection

We will find the shaded area without calculation

Intro

DIST08

Basel

Complex

<□>
Eul Form

Proof by Inspection

Look at the figure in two different ways

At each scale, we have three squares the same size, and we keep one of them (black) and omit the others.

So, the area of the shaded squares is $\frac{1}{3}$.

However, it is also given by the series

$$\left(\frac{1}{2}\right)^2 + \left(\frac{1}{4}\right)^2 + \left(\frac{1}{8}\right)^2 + \left(\frac{1}{16}\right)^2 + \cdots$$

Therefore we can sum the series:

$$\frac{1}{4} + \frac{1}{16} + \frac{1}{64} + \frac{1}{256} + \dots = \frac{1}{3}$$

The Basel Problem

Many mathematicians tried and failed to find the sum of the series of inverse squares:

$$\sum_{n=1}^{\infty} \frac{1}{n^2} = \left(\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \cdots\right)$$

Leibniz and the Bernoullis were unsuccessful.

In 1734 Leonhard Euler found the sum by a virtuoso performance.

We will now look at how he did it.

Ful Form

Taylor Series for Sine Wave

The Taylor series for sin x is

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \cdots$$

The coefficient of x^3 is $-\frac{1}{6}$.

We will express $\sin x$ in another way and find an alternative expression for the coeficient of x^3 .

Equating the two expressions will give a solution of the Basel Problem.

Fractals

Intro

DISTO

Basel

Complex

• □ ▶ • □ ▶ • □ ▶ • □ ▶ •

Eul Form

The zeros of the function sin x are at the points

$$\cdots - 3\pi - 2\pi - \pi \ 0 \ \pi \ 2\pi \ 3\pi \ \cdots$$

Euler expressed sin x in terms of the roots:

$$\sin x = B x \left(1 - \frac{x}{\pi}\right) \left(1 + \frac{x}{\pi}\right) \left(1 - \frac{x}{2\pi}\right) \left(1 + \frac{x}{2\pi}\right) \cdots$$

where *B* is a constant ($\lim_{x\to 0} \frac{\sin x}{x} = 1$ implies *B* = 1).

We can alternatively write this as

$$\sin x = Bx \left[1 - \left(\frac{x}{\pi}\right)^2 \right] \left[1 - \left(\frac{x}{2\pi}\right)^2 \right] \left[1 - \left(\frac{x}{3\pi}\right)^2 \right] \cdots$$

Intro

Taylor

Basel

Complex

Eul Form

$$\sin x = x \left[1 - \left(\frac{x}{\pi}\right)^2 \right] \left[1 - \left(\frac{x}{2\pi}\right)^2 \right] \left[1 - \left(\frac{x}{3\pi}\right)^2 \right] \cdots$$

Multiplying out, the coefficient of x^3 is

$$-\left(\frac{1}{\pi}\right)^2-\left(\frac{1}{2\pi}\right)^2-\left(\frac{1}{3\pi}\right)^2-\cdots$$

But this must equate to the coefficient $-\frac{1}{6}$ from the Taylor series:

$$-\left(\frac{1}{\pi}\right)^2 - \left(\frac{1}{2\pi}\right)^2 - \left(\frac{1}{3\pi}\right)^2 - \dots = -\frac{1}{6}$$

Therefore

Taylor

$$\sum_{n=1}^{\infty} \frac{1}{n^2} = \left(\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \cdots\right) = \frac{\pi^2}{6}$$

Fractals

 $\exists \rightarrow$

Intro

Euler's bravura solution of the Basel Problem is:

$$\sum_{n=1}^{\infty} \frac{1}{n^2} = \left(\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \cdots\right) = \frac{\pi^2}{6}$$

The rate of convergence is surprisingly slow: One million terms give only six digits of accuracy.

Table : Convergence of Basel Problem Series

10 terms	Sum = 1.549768
100 terms	Sum = 1.634984
1 000 terms	Sum = 1.643935
10 000 terms	Sum = 1.644834
100 000 terms	Sum = 1.644924

Eul Form

イロト イヨト イヨト イヨト

The result is

Taylor

DIST08

Intro

$$\sum_{n=1}^{\infty} \frac{1}{n^2} = \left(\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \cdots\right) = \frac{\pi^2}{6}$$

This is our first value of Riemann's ζ -function.

$$\zeta(s) = \sum_{n=1}^{\infty} \frac{1}{n^s}$$
 so $\zeta(2) = \frac{\pi^2}{6}$

We found that when s = 1, the series is the divergent *harmonic series*, so no value of $\zeta(1)$ is defined.

Positive and Negative Integers

The natural numbers arose at an early stage:

1 2 3 4 5 6 7 8 ···

Around 1550, negative numbers came into use.

···-8-7-6-5-4-3-2-10 1 2 3 4 5 6 7 8 ···

This suggests that the concept of negative numbers was difficult for mathematicians to grasp.

DIST0

Basel

Complex

Eul Form

A D N A B N A B N A B N

The Real Number Line

Gradually, new types of number were recognised. The gaps in the number line were "filled in".

Still, all the numbers could be arranged on a line.

In the fifteenth century, the numbers "broke out" and spread all over the plane.

Basel

Complex

Ful Form

Intro

Taylor

Extending Numbers to Solve Equations

A simple linear equation, ax = b, with *a* and *b* positive, is easy to solve: just divide by *a*.

However, an equation like ax + b = 0 (a > 0 and b > 0) can be solved only if negative quantities are admitted.

Mathematicians of the *Italian Renaissance* were the first to solve equations with negative quantities.

Del Ferro, Tartaglia, Cardano, Ferrari and Bombelli were foremost amongst these.

They found solutions to cubic and quartic equations.

Basel

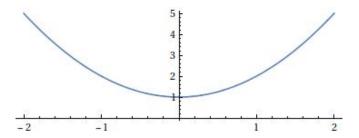

Complex

<□>
Eul Form

The Need for New Numbers

Quadratic equations like $ax^2 + bx + c = 0$ could be solved in some circumstances.

In other cases, there was no solution:

It is clear that $y = x^2 + 1$ does not vanish on the *x*-axis.

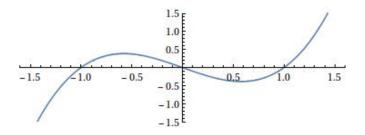

Basel

Complex

Eul Form

The Need for New Numbers

Cubic equations like $ax^3 + bx^2 + cx + d = 0$ always have a root: the graph always crosses the *x*-axis.

But the Cardano formula for the solution sometimes involves square roots of negative quantities.

This forced mathematicians to consider "imaginary" quantities.

DIST08

Intro

Basel

Complex

Eul Form

Numbers as Operators

We can interpret the product of two numbers

$a \times b$

as the number *a* operating on the number *b*.

For example, $2 \times b$ corresponds to the operation of doubling the number *b*.

It is remarkable that "*a* operating on *b*" gives the same result as "*b* operating on *a*"

 $a \times b = b \times a$

We see that *a* and *b* are both operators and numbers.

Multiplying twice by -1 means rotation through 2π .

Both positive and negative numbers unchanged.

Intro

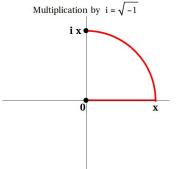

DIST08

Basel

Complex

Eul Form

(日)

Now imagine rotating through 90° or $\pi/2$ radians.

This brings us away from the real line.

We write the operator that rotates through $\pi/2$ as *i*.

What if we do this twice? We go through π radians!

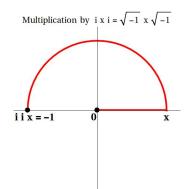

Intro

DIST08

Basel

Complex

< □ > < @ > < 글 > < 글 > Eul Form

Multiply twice by *i*

This means a rotation of 90° followed by another rotation of 90° .

So operating twice with i equals once with -1.

Therefore $i \times i = -1$ which means $i = \sqrt{-1}$.

The 14 and 14

Calculating with Complex Numbers

Addition of complex numbers is very simple: let $z_1 = x_1 + iy_1$ and $z_2 = x_2 + iy_2$. Then

$$z_1 + z_2 = (x_1 + iy_1) + (x_2 + iy_2) = (x_1 + x_2) + i(y_1 + y_2)$$

Multiplication is also simple: we just apply the rule for multiplying *i* by itself:

$$\begin{aligned} z_1 \ z_2 &= (x_1 + iy_1) \times (x_2 + iy_2) \\ &= x_1 x_2 + x_1 iy_2 + iy_1 x_2 + iy_1 iy_2 \\ &= (x_1 x_2 - y_1 y_2) + i(x_1 y_2 + y_1 x_2) \end{aligned}$$

Now we have extended the number system:

$$\mathbb{N} \subset \mathbb{Z} \subset \mathbb{Q} \subset \mathbb{R} \subset \mathbb{C} \,.$$

Euler's Fabulous Formula

Several surveys have been carried out to determine the most beautiful mathematical formula.

The consistent winner has been the formula

 $e^{i\pi} + 1 = 0$

First derived by Leonhard Euler.

DIST08

This is a remarkable result. It combines in one simple formula the five most important numbers

 $0 \ 1 \ \pi \ e$

We will now show where the result comes from.

Basel

Complex

Eul Form

Taylor Series for Sin, Cos and Exp

Recall the Taylor series for sin *x*, cos *x* **and** exp *x*:

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \cdots$$
$$\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \cdots$$
$$\exp x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \cdots$$

These series are valid for complex arguments. For example,

$$\exp z = 1 + z + \frac{z^2}{2!} + \frac{z^3}{3!} + \frac{z^4}{4!} + \cdots$$

Intro

DIST08

Basel

Complex

Eul Form

< □ > < □ > < □ > < □ > < □ > < □ > < □ >

Fractals

э

We now substitute the value $z = i\theta$ into the series

$$\exp z = 1 + z + \frac{z^2}{2!} + \frac{z^3}{3!} + \frac{z^4}{4!} + \cdots$$

$$\exp(i\theta) = 1 + i\theta + \frac{(i\theta)^2}{2!} + \frac{(i\theta)^3}{3!} + \frac{(i\theta)^4}{4!} + \frac{(i\theta)^5}{5!} + \cdots$$

$$= 1 + i\theta - \frac{\theta^2}{2!} - i\frac{\theta^3}{3!} + \frac{\theta^4}{4!} + i\frac{\theta^5}{5!} + \cdots$$

$$= \left(1 - \frac{\theta^2}{2!} + \frac{\theta^4}{4!} + \cdots\right)$$

$$+ i\left(\theta - \frac{\theta^3}{3!} + \frac{\theta^5}{5!} + \cdots\right)$$

$$= \cos(\theta) + i\sin(\theta)$$

Intro

DIST08

Basel

Complex

Eul Form

Fractals

æ

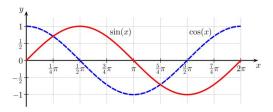

Again,

$$\exp(i heta) = \cos(heta) + i\sin(heta)$$

For $\theta = \pi$ this is

$$\exp(i\pi) = \cos(\pi) + i\sin(\pi)$$

But $cos(\pi) = -1$ and $sin(\pi) = 0$:

Therefore, we have $\exp(i\pi) = -1$ or

$$\exp(i\pi) + 1 = 0$$

Defining an Iterative Function

We define a sequence of complex numbers

$$z_0 = 0$$
, $z_{n+1} = z_n^2 + c$

where c is a (constant) complex parameter.

This gives the sequence

$$\{0, c, c^2 + c, c^4 + 2c^3 + c^2 + c, \dots\}$$

Does this sequence converge or diverge?

It depends on the value of the parameter c.

Simple Example of Escape Region

We define a geometric series by an iterative process:

 $\begin{array}{rcl} z_0 &= & \mathbf{C} \\ z_{n+1} &= & \mathbf{C} \, z_n \end{array}$

For |c| < 1 the sequence $\{z_n\}$ converges to zero.

For |c| > 1 the sequence $\{z_n\}$ diverges [*escapes*] to infinity.

We can colour-code the escape region to indicate how fast the sequence diverges.

"Is Minic Freagra ar Imeall"

All this AweSum Majesty comes from the simple iterative process in the complex plane:

$$z_{n+1}=z_n^2+c$$

We plot the "escape time" as a function of the complex valued parameter *c*.

In the black region, $\{z_n\}$ remains bounded. Outside this region, it diverges to infinity.

The rate of divergence depends on *c*. The plots are colour-coded according to this rate.
