Meaning and Content of Mathematics

The word Mathematics comes from Greek $\mu\alpha\theta\eta\mu\alpha$ (máthéma), meaning "knowledge" or "study" or "learning".

- It is the study of topics such as
 - Quantity (numbers)
 - Structure (patterns)
 - Space (geometry)
 - Change (analysis).

3

What purpose could the Nippur Tablet have had?

What use could there be for a list of squares?

Perhaps it was used for multiplication!

We show how this is done in the next slide.

Cantor

NipTab

Greek 1

Topology

Multiplication by Squaring

Let *a* and *b* be any two numbers.

$$(a+b)^2 = a^2 + 2ab + b^2$$

 $(a-b)^2 = a^2 - 2ab + b^2$

Subtracting, we get

$$(a+b)^2 - (a-b)^2 = 4ab$$

Thus, we can find the product using squares:

$$ab = \frac{1}{4}[(a+b)^2 - (a-b)^2]$$

Intro

Greek 1

.

Topology

Multiplication by Squaring

Again,

$$ab = \frac{1}{4}[(a+b)^2 - (a-b)^2]$$

Let us take a particular example: 37×13 .

$$a = 37$$
 $b = 13$ $a + b = 50$ $a - b = 24$.

$$\frac{1}{4}[(a+b)^2 - (a-b)^2] = \frac{1}{4}[50^2 - 24^2]$$

= $\frac{1}{4}[2500 - 576]$
= $\frac{1}{4}[1924]$
= 481
= 37×13 .

Perhaps this was the function of the Nippur tablet.

Set Theory: Controversy

Cantor was strongly criticized by

- Leopold Kronecker.
- Henri Poincaré.
- Ludwig Wittgenstein.

Cantor is a "corrupter of youth" (LK). Set Theory is a "grave disease" (HP). Set Theory is "nonsense; laughable; wrong!" (LW).

Adverse criticism like this may well have contributed to Cantor's mental breakdown.

Cantor

Set Theory: A Difficult Birth

Set Theory brought into prominence several *paradoxical results*.

Many mathematicians had great difficulty accepting some of the stranger results.

Some of these are still the subject of discussion and disagreement today.

To illustrate the difficulty of accepting new ideas, let's consider the problem of a river flowing uphill.

Set Theory: A Difficult Birth

Cantor's Set Theory was of profound philosophical interest.

It was *so innovative* that many mathematicians could not appreciate its fundamental value and importance.

Gösta Mittag-Leffler was reluctant to publish it in his *Acta Mathematica*. He said the work was "100 years ahead of its time".

David Hilbert said: "We shall not be expelled from the paradise that Cantor has created for us."

A Passionate Mathematician

In 1874, Cantor married Vally Guttmann.

They had six children. The last one, a son named Rudolph, was born in 1886.

According to Wikipedia:

"During his honeymoon in the Harz mountains, Cantor spent much time in mathematical discussions with Richard Dedekind."

[Cantor had met the renowned mathematician Dedekind two years earlier while he was on holiday in Switzerland.]

Books on a Shelf

Ten books are arranged on a shelf. They include an Almanac (A) and a Bible (B).

BIG IDEA: SYMMETRY.

Every SOLUTION correponds to a NONSOLUTION.

Just switch positions of A and B!

The total number of arrangements is 10!. For half of these, A is to the left of B.

So, answer is $\frac{1}{2}(10 \times 9 \times \cdots \times 1) = \frac{1}{2} \times 10!$

・ロト ・ 四ト ・ ヨト ・ ヨト Topology

Set Theory I

The concept of *set* is very general.

Sets are the basic building-blocks of mathematics.

Definition: A set is a collection of objects.

The objects in a set are called the elements.

Examples:

- All the prime numbers, $\mathbb P$
- All even numbers: $\mathbb{E} = \{2, 4, 6, 8...\}$
- All the people in Ireland: See Census returns.
- The colours of the rainbow: {Red, ..., Violet}.
- Light waves with wavelength $\lambda \in [390 700 \text{nm}]$

Intro

Greek 1

Topology

Do You Remember Venn?

John Venn was a logician and philosopher, born in Hull, Yorkshire in 1834.

He studied at Cambridge University, graduating in 1857 as sixth Wrangler.

Venn introduced his diagrams in *Symbolic Logic*, a book published in 1881.

Venn Diagrams

Venn diagrams are very valuable for showing elementary properties of sets.

They comprise a number of overlapping circles.

The interior of a circle represents a collection of numbers or objects or perhaps a more abstract set.

э Unarv Nums

The Universe of Discourse

We often draw a rectangle to represent the *universe*, the set of all objects under current consideration.

For example, suppose we consider all species of animals as the universe.

A rectangle represents this universe.

Two circles indicate subsets of animals of two different types.

Topology

gy

A D > A B > A B > A B >

Unary Nums

э.

The Technical (Logical) Definitions

Let A and B be two sets.

The union of the sets $A \cup B$ is defined by

$$[x \in A \cup B] \iff [(x \in A) \lor (x \in B)]$$

The intersection of the sets $A \cap B$ is defined by

$$[x \in A \cap B] \iff [(x \in A) \land (x \in B)]$$

There is an intimate connection between Set Theory and Symbolic Logic.

The Greek Alphabet, Part 1

Ελληνικό αλφάβητο

Some Motivation

- Greek letters are used extensively in maths.
- Greek alphabet is the basis of the Roman one.
- Also the basis of the Cyrillic and others.
- A great advantage for touring in Greece.
- You already know several of the letters.
- It is simple to learn in small sections.

э.

Euler reduced the problem to its essentials, removing all extraneous details.

He replaced the map above by the graph on the right.

A simple argument showed that no journey that crosses each bridge exactly once is possible.

Except at the termini of the route, each path arriving at a vertex must have a corresponding path leaving it.

Only two vertices with an odd number of edges are possible for a solution to exist.

The Unary System

The simplest numeral system is the unary system.

Each natural number is represented by a corresponding number of symbols.

If the symbol is " | ", the number seven would be represented by | | | | | | |.

Tally marks represent one such system, which is still in common use.

The unary system is only useful for small numbers.

The unary notation can be abbreviated, with new symbols for certain values.

Topology

Sign-Value Notation

The *five-bar gate* system groups 5 strokes together.

Normally, distinct symbols are used for powers of 10.

If " | " stands for one, " \land " for ten and " \uparrow " for 100, then the number *123* becomes $\uparrow \land \land / / /$

There is no need for a symbol for zero.

This is called sign-value notation.

Ancient Egyptian numerals were of this type.

Roman numerals were a modification of this idea.

Egypyian Numerals

Value	1	10	100	1,000	10,000	100,000	1 million, or many
Hieroglyph	I	Ω	٩	s X	Î	or D	La La La
Description	Single stroke	Heel bone	Coil of rope	Water lily (also called Lotus)	Bent Finger	Tadpole or Frog	Man with both hands raised, perhaps Heh. ^[3]

The arrangement of symbols is not important.

What number is this?

This pattern represents the number 4622.

Hebrew Number Values

The 22 letters of the Hebrew alphabet were used also as numerals.

Each letter corresponded to a numerical value.

Greek Numerals

	Units	Tens	Hundreds ρ_{rho}	
1	OL alpha	l iota		
2	β	К	σ	
	beta	_{kappa}	sigma	
3	γ	λ	τ	
	_{gamma}	lambda	_{tau}	
4	δ delta	μ_{mu}	U upsilon	
5	E	V	ф	
	epsilon	nu	_{phi}	
6	f digamma	۳xi	χ _{chi}	
7	ζ	O	Ψ	
	zeta	omicron	_{psi}	
8	η _{eta}	$\pi_{_{\mathrm{pi}}}$	ω omega	
9	θ	9	A	
	theta	koppa	sampi	

The 24 letters of the Greek alphabet had corresponding numerical values.

They were supplemented by three additional letters, which are now archaic.

$$\mathbf{243} = \sigma \mu \gamma$$
