# **Meaning and Content of Mathematics**

The word Mathematics comes from Greek  $\mu\alpha\theta\eta\mu\alpha$  (máthéma), meaning "knowledge" or "study" or "learning".

- It is the study of topics such as
  - Quantity (numbers)
  - Structure (patterns)
  - Space (geometry)
  - Change (analysis).

### **Outline**

Introduction

### **The Nippur Tablet**

# **The Nippur Tablet**

#### What is the last line? The last line states that

 $13\!\times\!13=2\!\times\!60\!+\!49=169$ 

#### But it could be

$$13 \times 13 = 2 \times 60^2 + 40 \times 60 + 9$$

which comes to 9609. Babylonian numeration is *ambiguous.* 

There is no zero!

< □ ▶ < 濟 ▶ < 臺 ▶ < 臺 ▶ Greek 1

What purpose could the Nippur Tablet have had?

What use could there be for a list of squares?

Perhaps it was used for multiplication!

After a brief refresher on school maths, we show how this can be done.

Cantor

Greek 1

## **Refresher: Some School Maths**

#### How do we do multiplication of binomials

 $(a+b) \times (c+d)$ ?

First, let's take actual numbers:

$$(3+7) \times (5+9) = 10 \times 14 = 140$$

This can also be done by expanding:

$$\begin{array}{rcl} 3 \times (5+9) &+& 7 \times (5+9) \\ &=& (3 \times 5) + (3 \times 9) + (7 \times 5) + (7 \times 9) \\ &=& 15 + 27 + 35 + 63 \\ &=& 140 \end{array}$$

Greek 1

・ロット ( 母 ) ・ ヨ ) ・ コ )

### **Refresher: Some School Maths**

Now let us take the algebraic form:

 $(a+b) \times (c+d)$ 

This can also be evaluated by expanding twice:

$$a \cdot (c+d) + b \cdot (c+d) = a \cdot c + a \cdot d + b \cdot c + b \cdot d$$

A special case where the two factors are equal:

$$(a+b) \cdot (a+b) = a \cdot a + a \cdot b + b \cdot a + b \cdot b$$
$$= a^2 + 2ab + b^2$$

э.

Intro

Greek 1

(4 回 ) (4 回 ) (4 回 )

# **Multiplication by Squaring**

Let *a* and *b* be any two numbers.

$$(a+b)^2 = a^2 + 2ab + b^2$$
  
 $(a-b)^2 = a^2 - 2ab + b^2$ 

Subtracting, we get

$$(a+b)^2 - (a-b)^2 = 4ab$$

Thus, we can find the product using squares:

$$\frac{1}{4}\bigg[(a+b)^2-(a-b)^2\bigg]=ab$$

э.

Intro

A B K A B K

Greek 1

# **Multiplication by Squaring**

$$\frac{1}{4}\bigg[(a+b)^2-(a-b)^2\bigg]=ab$$

Let us take a particular example:  $37 \times 13 = ?$ 

$$a = 37 \quad b = 13 \quad a + b = 50 \quad a - b = 24.$$
  
$$\frac{1}{4}[50^2 - 24^2] = \frac{1}{4}[2500 - 576]$$
  
$$= \frac{1}{4}[1924]$$
  
$$= 481$$
  
$$= 37 \times 13.$$

#### Perhaps this was the function of the Nippur tablet.

# **Books on a Shelf**

Ten books are arranged on a shelf. They include an Almanac (A) and a Bible (B).

Suppose A must be to the left of B (not necssarily beside it).

How many possible arrangements are there?

Intro

Cantor

Greek 1

# **Books on a Shelf**

Ten books are arranged on a shelf. They include an Almanac (A) and a Bible (B).

**BIG IDEA: SYMMETRY.** 

*Every SOLUTION correponds to a NON-SOLUTION: Just switch the positions of A and B!* 

The total number of arrangements is 10!. For half of these, A is to the left of B.

So, answer is  $\frac{1}{2}(10 \times 9 \times \cdots \times 1) = \frac{1}{2} \times 10!$

# Set Theory: Controversy

Cantor was strongly criticized by

- Leopold Kronecker.
- Henri Poincaré.
- Ludwig Wittgenstein.

Cantor is a "corrupter of youth" (LK). Set Theory is a "grave disease" (HP). Set Theory is "nonsense; laughable; wrong!" (LW).

Adverse criticism like this may well have contributed to Cantor's mental breakdown.

# Set Theory: A Difficult Birth

Set Theory brought into prominence several *paradoxical results*.

Many mathematicians had great difficulty accepting some of the stranger results.

Some of these are still the subject of discussion and disagreement today.

To illustrate the difficulty of accepting new ideas, let's consider the problem of a river flowing uphill.

# Set Theory: A Difficult Birth

Cantor's Set Theory was of profound philosophical interest.

It was *so innovative* that many mathematicians could not appreciate its fundamental value and importance.

Gösta Mittag-Leffler was reluctant to publish it in his *Acta Mathematica*. He said the work was "100 years ahead of its time".

David Hilbert said: "We shall not be expelled from the paradise that Cantor has created for us."

э.

Greek 1

### A Passionate Mathematician

In 1874, Cantor married Vally Guttmann.

They had six children. The last one, a son named Rudolph, was born in 1886.

According to Wikipedia:

*"During his honeymoon in the Harz mountains, Cantor spent much time in mathematical discussions with Richard Dedekind."* 

[Cantor had met the renowned mathematician Dedekind two years earlier while he was on holiday in Switzerland.]

The Greek Alphabet, Part 1

# Ελληνικό αλφάβητο

Some Motivation

- Greek letters are used extensively in maths.
- Greek alphabet is the basis of the Roman one.
- Also the basis of the Cyrillic and others.
- A great advantage for touring in Greece.
- You already know several of the letters.
- It is simple to learn in small sections.

### **The First Six Letters**

We will take the alphabet in groups of six letters.

Let us focus first on the *small letters* and come back to the big ones later.

Intro

DIST02

Cantor

Greek 1

1

Sets 1

э.

You know  $\alpha$  and  $\beta$  from the word *Alphabet:*  $\alpha \beta$ You have heard of *gamma-rays*, or  $\gamma$ -rays

Both  $\delta$  and  $\epsilon$  are widely used in maths. For example, the definition of *continuity* of function f(x) at x = a is

$$orall \epsilon > \mathbf{0} \; \exists \delta > \mathbf{0} : |\mathbf{x} - \mathbf{a}| < \delta \Rightarrow |f(\mathbf{x}) - f(\mathbf{a})| < \epsilon$$

A famous unsolved maths problem, Riemann's Hypothesis, is concerned with zeros of the *Riemann zeta-function:* 

$$\zeta(s) = \sum_{n=1}^{\infty} \frac{1}{n^s}$$

Now we already know the first six letters!

Set Theory I

Sets 1

э.

Intro

Cantor

Greek 1

<ロ> < 回 > < 回 > < 回 > < 回 > <</p>

# Set Theory I

The concept of *set* is very general.

Sets are the basic building-blocks of mathematics.

Definition: A set is a collection of objects.

The objects in a set are called the elements.

Examples:

- All the prime numbers,  $\mathbb P$
- All even numbers:  $\mathbb{E} = \{2, 4, 6, 8...\}$
- All the people in Ireland: See Census returns.
- The colours of the rainbow: {Red, ..., Violet}.
- Light waves with wavelength  $\lambda \in [390 700 \text{nm}]$

Greek 1

### **Do You Remember Venn?**

John Venn was a logician and philosopher, born in Hull, Yorkshire in 1834.

He studied at Cambridge University, graduating in 1857 as sixth Wrangler.

Venn introduced his diagrams in *Symbolic Logic*, a book published in 1881.

# Venn Diagrams

Venn diagrams are very valuable for showing elementary properties of sets.

They comprise a number of overlapping circles.

The interior of a circle represents a collection of numbers or objects or perhaps a more abstract set.

Intro

Cantor

・ 母 ト ・ ヨ ト ・ ヨ ト

Greek 1

# The Universe of Discourse

We often draw a rectangle to represent the *universe*, the set of all objects under current consideration.

For example, suppose we consider all species of animals as the universe.

A rectangle represents this universe.

Two circles indicate subsets of animals of two different types.

나 ∢ ≣ ▶ ∢ ≣ ▶ Greek 1

DIST02

Cantor

# The Technical (Logical) Definitions

Let A and B be two sets.

The union of the sets  $A \cup B$  is defined by

$$[x \in A \cup B] \iff [(x \in A) \lor (x \in B)]$$

The intersection of the sets  $A \cap B$  is defined by

$$[x \in A \cap B] \iff [(x \in A) \land (x \in B)]$$

# There is an intimate connection between Set Theory and Symbolic Logic.
