Meaning and Content of Mathematics

The word Mathematics comes from Greek $\mu\alpha\theta\eta\mu\alpha$ (máthéma), meaning "knowledge" or "lesson" or "learning".

It is the study of topics such as

- Quantity: [Numbers. Arithmetic]
- Structure: [Patterns. Algebra]
- Space: [Geometry. Topology]
- Change: [Analysis. Calculus]

Carl Friedrich Gauss (1777–1855)

A German mathematician who made profound contributions to many fields of mathematics:

- Number theory
- Algebra
- Statistics
- Analysis
- Differential geometry
- Geodesy & Geophysics
- Mechanics & Electrostatics
- Astronomy

One of the greatest mathematicians of all time.

Gauss Outsmarts his Teacher

Gauss was a genius. He was known as

Primes

The Prince of Mathematicians.

When very young, Gauss outsmarted his teacher.

I can now reveal a fact unknown to historians:

The teacher got his own back. Ho! ho! ho!

Apps

RNG

DIST04

Gauss

Gauss Outsmarts his Teacher

Gauss's school teacher tasked the class:

Add up all the whole numbers from 1 to 100.

Gauss solved the problem in a flash.

He wrote the correct answer,

 $\boldsymbol{5},\boldsymbol{050}$

on his slate and handed it to the teacher.

How did Gauss do it?

RNG

∃ ► < ∃ ►</p>

First, Gauss wrote the numbers in a row:								
	1	23	98	99 10	0			
Next he wrote them again, <i>in reverse order:</i> 100 99 98 3 2 1								
Then he added the two rows, column by column:								
1	2	3		98	99	100		
100	99	98		3	2	1		
101	101	101		101	101	101		
Clearly, the total for the two rows is 10,100.								

But every number from 1 to 100 is counted twice. $\therefore 1 + 2 + 3 + \cdots + 98 + 99 + 100 = 5,050$

Triangular Numbers

Gauss had calculated the 100-th triangular number.

Let us take a geometrical look at the sums of the first few natural numbers:

We see that the sums can be arranged as triangles.

Intro

Primes

Apps

RNG

T04

Triangular Numbers

The first few triangular numbers are $\{1, 3, 6, 10, 15, 21\}$.

 $T_1 = 1$ $T_2 = 3$ $T_3 = 6$ $T_4 = 10$ $T_5 = 15$ $T_6 = 21$ イロト イヨト イヨト

Gauss

Primes

Apps

RNG

DIST0

Let's look at the 10th triangular number.

For n = 10 the pattern is:

How do we compute its value? Gauss's method!

Apps

RNG

<ロト < 部 ト < 直 ト < 亘 > G DIST04

It is easy to show that the *n*-th triangular number is

$$T_n = (1 + 2 + 3 + \dots + n) = \frac{1}{2}n(n+1)$$

We do just as Gauss did, and list the numbers twice:

There are *n* columns, each with total n + 1.

So the grand total is $n \times (n+1)$.

Each number has been counted twice, so

$$T_n=\frac{1}{2}n(n+1)$$

Topo 3

э.

Apps

RNG

Let's check this for Gauss's problem of n = 100:

$$T_{100} = (1 + 2 + 3 + \dots + 100) = \frac{100 \times 101}{2} = 5,050$$

Gauss's approach was to look at the problem from a new angle.

Such lateral thinking is very common in mathematics:

Problems that look difficult can sometimes be solved easily when tackled from a different angle.

Two Triangles Make a Square

A nice property of *consecutive* triangular numbers:

$T_3 + T_4 = 6 + 10 = 16 = 4^2$

Intro

Primes

Apps

RNG

DIST04

(日)

Торо 3

э.

Triangular Numbers

We have seen, by means of geometry that the sum of two consecutive triangular numbers is a square.

Now let us prove this algebraically:

$$T_n + T_{n+1} = \frac{1}{2}n(n+1) + \frac{1}{2}(n+1)(n+2)$$

= $\frac{1}{2}(n+1)[n+(n+2)]$
= $\frac{1}{2}(n+1)[2(n+1)]$
= $(n+1)^2$

The result is a perfect square.

I leave you to check the details!

Prime & Composite Numbers

A prime number is a number that cannot be broken into a product of smaller numbers.

The first few primes are 2, 3, 5, 7, 11, 13, 17 and 19.

There are 25 primes less than 100.

Numbers that are not prime are called composite. They can be expressed as *products of primes*.

Thus, $6 = 2 \times 3$ is a composite number.

The number 1 is neither prime nor composite.

The Atoms of the Number System

The primes play a role in mathematics analogous to the elements of Mendeleev's Periodic Table.

Just as a chemical molecule can be constructed from the 100 or so fundamental elements, any whole number be constructed by combining prime numbers.

The primes 2, 3, 5 are the *hydrogen, helium and lithium* of the number system.

Some History

In 1792 Carl Friedrich Gauss, then only 15 years old, found that the proportion of primes less that *n* decreased approximately as $1/\log n$.

Around 1795 Adrien-Marie Legendre noticed a similar logarithmic pattern of the primes, but it was to take another century before a proof emerged.

In a letter written in 1823 the Norwegian mathematician Niels Henrik Abel described the distribution of primes as *the most remarkable result in all of mathematics.*

Topo 3

Percentage of Primes Less than N

Table: Percentage of Primes less than N

10	4	40.0%
100	25	25.0%
1,000	168	16.8%
1,000,000	78,498	7.8%
1,000,000,000	50,847,534	5.1%
1,000,000,000,000	37,607,912,018	3.8%

We can see that the percentage of primes is falling off with increasing size.

But the rate of decrease is very slow.

Is There a Pattern in the Primes?

It is a simple matter to make a list of all the primes less that 100 or 1000.

It soon becomes evident that no clear pattern is emerging.

The primes appear to be scattered at random.

Figure: Prime numbers up to 100

Is There a Pattern in the Primes?

Do the primes settle down as *n* becomes larger?

Between 9,999,900 and 10,000,000 (100 numbers) there are 9 primes.

Primes

Between 10.000,000 and 10,000,100 (100 numbers) there are just 2 primes.

What kind of function could generate this behaviour?

Apps

RNG

We just do not know.

Gauss

DIST04

Is There a Pattern in the Primes?

The gaps between primes are very irregular.

- Can we find a pattern in the primes?
- Can we find a formula that generates primes?
- How can we determine the hundreth prime?
- What is the thousandth? The millionth?

Gauss

WolframAlpha is a Computational Knowledge Engine.

Wolfram Alpha is based on Wolfram's flagship product Mathematica, a computational platform or toolkit that encompasses computer algebra, symbolic and numerical computation, visualization, and statistics.

WolframAlpha is freely available via a web browser.

Euler's Formula for Primes

No mathematician has ever found a *useful* formula that generates all the prime numbers.

Euler found a beautiful little formula:

*n*² – *n* + 41

This gives prime numbers for *n* between 1 and 40.

But for n = 41 we get

$$41^2 - 41 + 41 = 41 \times 41$$

Apps

a composite number.

Some Unsolved Problems

There appear to be an infinite number of prime pairs

```
(2n-1, 2n+1)
```

There are also gaps of arbitrary length:

for example, there are 13 consecutive composite numbers between 114 and 126.

We can find gaps as large as we like:

Challenge: Show that N! + 1 is followed by a sequence of N - 1 composite numbers.

RNG

DIST04

・ロット (母) ・ ヨ) ・ コ)

Primes have been used as markers of civilization.

In the novel *Cosmos*, by Carl Sagan, the heroine detects a signal:

- First 2 pulses
- Then 3 pulses
- Then 5 pulses
- ▶ ...
- Then 907 pulses.

In each case, a prime number of pulses.

Could this be due to any natural phenomenon? Is it evidence of extra-terrestrial intelligence?

What is Randomness?

Randomness is a *slippery concept,* defying precise definition.

Toss a coin and get a sequence like HTTHHHTHTT. We can write this as a binary string 1001110100.

Some uses of Random Numbers:

- Computer simulations of fluid flow.
- Interactions of subatomic particles.
- Evolution of galaxies.

To get random numbers, coin tossing is impractical. We need more effective methods.

RNG

DIST04

(日)

Торо 3

э

Defining Randomness?

Richard von Mises (1919): A binary sequence is random if the proportion of zeros and ones approaches 50% and if this is also true for any sub-sequence. Consider (0101010101).

Andrey Kolmogorov defined the complexity of a binary sequence as the length of a computer program or algorithm that generates it.

The phrase a sequence of one million 1's completely defines a sequence.

Non-random sequences are compressible. Randomness and incompressibility are equivalent.

Knot Theory

A knot is an embedding of the unit circle S^1 into three-dimensional space R^3 .

Two knots are equivalent if one can be distorted into the other without breaking it.

Apps

RNG

DIS

Topo 3

э

A knot is a mapping of the unit circle into three-space.

Figure: Left: Unknot. Right: Trefoil.

Apps

These two knots aren't equivalent: we can't distort the circle into the trefoil without breaking it.

크

- The genus of a topological surface is, in simple terms, the number of holes in it.
- A sphere has no holes, so has genus 0.
- A doughnut has one hole, so has genus 1.
- Surfaces can have any number of holes; any genus.
