Meaning and Content of Mathematics

The word Mathematics comes from Greek $\mu\alpha\theta\eta\mu\alpha$ (máthéma), meaning "knowledge" or "lesson" or "learning".

It is the study of topics such as

- Quantity: [Numbers. Arithmetic]
- Structure: [Patterns. Algebra]
- Space: [Geometry. Topology]
- Change: [Analysis. Calculus]

You may be familiar with the Möbius strip or Möbius band. It has one side and one edge.

It was discovered independently by August Möbius and Johann Listing in the same year, 1858.

Intro

Sources

Building the Band

It is easy to make a Möbius band from a paper strip.

For a geometrical construction, we start with a circle and a small line segment with centre on this circle.

Intro

Möb1

Sieve

e

Sources

Now move the line segment around the circle:

To show the boundary of the surface, we color one end of the line segment red and the other magenta.

Intro

Cookie Row

Moessner's Magic

1 ទ

Sieve

Sources

Now, as the line moves, we give it a half-twist:

Sources

The two boundary curves now join up to become one:

Intro

The Möbius Band has only one side.

It is possible to get from any point on the surface to any other point without crossing the edge.

The surface also has just one edge.

Equations for the Möbius Band

The process of moving the line segment around the circle leads us to the equations for the Möbius band.

In cylindrical polar coordinates the circle is $(r, \theta, z) = (a, \theta, 0)$.

The tip of the segment, relative to its centre, is

 $(r, \theta, z) = (b \cos \phi, 0, b \sin \phi)$

where $b = \frac{1}{2}\ell$ is half the segment length and $\phi = \alpha\theta$, with α determining the amount of twist.

The tip of the line has $(r, z) = (a + b \cos \alpha \theta, b \sin \alpha \theta)$.

Möb1

.T1 👘

Sieve

123

Equations for the Möbius Band

In cartesian coordinates, the equations become

 $x = (a + b\cos\alpha\theta)\cos\theta$ $y = (a + b\cos\alpha\theta)\sin\theta$ $z = (b\sin\alpha\theta)$

These are the parametric equations for the twisted bands, with $\theta \in [0, 2\pi]$ and $b \in [-\ell, \ell]$.

For the Möbius band, $\alpha = \frac{1}{2}$.

Now we delete every third number and calculate the sequence of partial sums.

Then we delete every second number and calculate the sequence of partial sums:

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16
1	3		7	12		19	27		37	48		61	75		91
1			8			27			64			125			216

The result is the sequence of perfect cubes:

 $1^3 \ 2^3 \ 3^3 \ 4^3 \ 5^3 \ 6^3$.

Intro

Möb1

Sie

Sieve

Sources

The Moessner Construction also works for larger n:

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16
1	3	6		11	17	24		33	43	54		67	81	96	
1	4			15	32			65	108			175	256

Eratosthenes Measured the Earth

Music3

Intro

Eratosthenes was the Librarian in Alexandria when Archimedes flourished in Syracuse.

They were "pen-pals".

Eratosthenes estimated size of the Earth.

He devised a systematic procedure for generating the prime numbers: the Sieve of Eratosthenes.

Music3

Intro

ŀ

Sources

The idea:

- List all natural numbers up to n.
- Circle 2 and strike out all multiples of two.
- Move to the next number, 3.
- Circle it and strike out all multiples of 3.
- Continue till no more numbers can be struck out.

Music3

Sources

The idea:

- List all natural numbers up to n.
- Circle 2 and strike out all multiples of two.
- Move to the next number, 3.
- Circle it and strike out all multiples of 3.
- Continue till no more numbers can be struck out.

The numbers that have been circled are the prime numbers. Nothing else survives.

It is sufficient to go as far as \sqrt{n} .
