Strictly convex norms and topology

July 2011 1 / 11

## Strictly convex norms

#### Definition (Clarkson, 1936)

A norm  $\|\cdot\|$  is called *strictly convex* if x = y whenever  $\|x\| = \|y\| = \frac{1}{2} \|x + y\|$ .

Natural norms are usually not strictly convex, but often a space can be given an *equivalent* strictly convex norm.

We concentrate on strictly convex dual norms on dual spaces.

## Theorem (Šmulyan, 1940)

If  $\|\cdot\|$  is a strictly convex *dual norm* on  $X^*$  then the predual  $\|\cdot\|$  on X is Gâteaux smooth.

## Strictly convex norms

#### Definition (Clarkson, 1936)

A norm  $\|\cdot\|$  is called *strictly convex* if x = y whenever  $||x|| = ||y|| = \frac{1}{2} ||x + y||.$ 

#### Natural norms are usually not strictly convex, but often a space can be given an equivalent strictly convex norm.

#### Definition (Clarkson, 1936)

A norm  $\|\cdot\|$  is called *strictly convex* if x = y whenever  $\|x\| = \|y\| = \frac{1}{2} \|x + y\|$ .

Natural norms are usually not strictly convex, but often a space can be given an *equivalent* strictly convex norm.

We concentrate on strictly convex *dual* norms on dual spaces.

## Theorem (Šmulyan, 1940)

If  $\|\cdot\|$  is a strictly convex *dual norm* on  $X^*$  then the predual  $\|\cdot\|$  on X is Gâteaux smooth.

#### Definition (Clarkson, 1936)

Natural norms are usually not strictly convex, but often a space can be given an *equivalent* strictly convex norm.

We concentrate on strictly convex dual norms on dual spaces.

### Theorem (Šmulyan, 1940)

If  $\|\cdot\|$  is a strictly convex *dual norm* on  $X^*$  then the predual  $\|\cdot\|$  on X is Gâteaux smooth.

#### Question

Given a (dual) Banach space, does it admit a strictly convex (dual) norm?

Yes if e.g. X is separable, reflexive (more generally weakly compactly generated) or if  $X = L_1(\mu)$ .

No if e.g.  $X = \ell_{\infty}^{c}(\Gamma)$ ,  $\Gamma$  uncountable.

Figures such as Day, Lindenstrauss, Mercourakis, Talagrand and Haydon have considered aspects of this question.

But no general characterization, in terms of linear topological structure, has emerged.

### Definition

A topological space X has (\*) if there are families  $\mathscr{U}_n$ ,  $n \in \mathbb{N}$ , of open sets, such that for any  $x, y \in X$ , there is  $n \in \mathbb{N}$  satisfying

•  $\{x, y\} \cap \bigcup \mathscr{U}_n$  is non-empty

②  ${x,y} \cap U$  is at most a singleton for all  $U \in \mathscr{U}_n$ .

#### Example

 $X = \mathbb{R}, \mathscr{U}_n = \{ \text{open intervals of length } n^{-1} \}.$ 

Spaces having  $G_{\delta}$ -diagonals have (\*).

There are many compact non-metrizable spaces having (\*).

### Definition

A topological space X has (\*) if there are families  $\mathscr{U}_n$ ,  $n \in \mathbb{N}$ , of open sets, such that for any  $x, y \in X$ , there is  $n \in \mathbb{N}$  satisfying

- $\{x, y\} \cap \bigcup \mathscr{U}_n$  is non-empty
- ②  $\{x, y\}$  ∩ *U* is at most a singleton for all  $U \in \mathscr{U}_n$ .

#### Example

 $X = \mathbb{R}, \mathscr{U}_n = \{ \text{open intervals of length } n^{-1} \}.$ 

Spaces having  $G_{\delta}$ -diagonals have (\*).

There are many compact non-metrizable spaces having (\*).

#### Proposition

If a dual Banach space  $X^*$  admits a strictly convex *dual* norm, then  $(B_{X^*}, w^*)$  has (\*).

#### Theorem

The space  $X^*$  admits a strictly convex dual norm if and only if  $(B_{X^*}, w^*)$  has (\*) with slices.

#### Question

To what extent can we do without the geometry, i.e. without slices?

#### Proposition

If a dual Banach space  $X^*$  admits a strictly convex *dual* norm, then  $(B_{X^*}, w^*)$  has (\*).

#### Theorem

The space  $X^*$  admits a strictly convex dual norm if and only if  $(B_{X^*}, w^*)$  has (\*) with slices.

#### Question

To what extent can we do without the geometry, i.e. without slices?

#### Proposition

If a dual Banach space  $X^*$  admits a strictly convex *dual* norm, then  $(B_{X^*}, w^*)$  has (\*).

#### Theorem

#### Question

To what extent can we do without the geometry, i.e. without slices?

## Consequences of (\*)

We study C(K) spaces because they form a universal class:  $X \hookrightarrow C(B_{X^*}, w^*).$ 

#### Theorem

If *K* is compact and scattered then  $C(K)^*$  admits a strictly convex dual norm if and only if *K* has (\*).

#### Theorem

- If X has (\*) then X is fragmentable.
- Countably compact spaces having (\*) are compact (generalizes Chaber). In particular,  $\omega_1$  does not have (\*).
- If *L* is locally compact and has (\*) then  $L \cup \{\infty\}$  is countably tight.

## Consequences of (\*)

We study C(K) spaces because they form a universal class:  $X \hookrightarrow C(B_{X^*}, w^*)$ .

#### Theorem

If *K* is compact and scattered then  $C(K)^*$  admits a strictly convex dual norm if and only if *K* has (\*).

#### Definition (Gruenhage, 1987)

A topological space X,  $card(X) \le c$ , is *Gruenhage* if there are open sets  $U_n$ ,  $n \in \mathbb{N}$ , such that if  $x, y \in X$  then  $\{x, y\} \cap U_n$  is a singleton for some n.

Metrizable,  $\sigma$ -discrete and descriptive compact spaces are Gruenhage. The tree  $\sigma \mathbb{Q}$  is Gruenhage but not descriptive.

All Gruenhage spaces have (\*).

### Theorem (Smith, 2009)

If K is Gruenhage compact then  $C(K)^*$  admits a strictly convex dual norm.

### Definition (Gruenhage, 1987)

A topological space X,  $card(X) \le c$ , is *Gruenhage* if there are open sets  $U_n$ ,  $n \in \mathbb{N}$ , such that if  $x, y \in X$  then  $\{x, y\} \cap U_n$  is a singleton for some n.

Metrizable,  $\sigma$ -discrete and descriptive compact spaces are Gruenhage. The tree  $\sigma \mathbb{Q}$  is Gruenhage but not descriptive.

### Examples

Kunen's compact S-space K is Gruenhage. In particular, C(K)\* admits a strictly convex dual norm.

- Ostaszewski's space O is scattered but does not have (\*), thus C(O)\* does not admit a strictly convex dual norm.
- Using CH or b = ℵ<sub>1</sub>, there exist compact non-Gruenhage spaces having (\*), and with cardinality ℵ<sub>1</sub>.

### Proposition

(MA) If L, card(L) < c, is locally compact, locally countable and has (\*) then L is  $\sigma$ -discrete (and thus Gruenhage).

#### Examples

- Kunen's compact S-space K is Gruenhage. In particular, C(K)\* admits a strictly convex dual norm.
- Ostaszewski's space O is scattered but does not have (\*), thus C(O)\* does not admit a strictly convex dual norm.
- Using CH or b = ℵ₁, there exist compact non-Gruenhage spaces having (\*), and with cardinality ℵ₁.

### Proposition

(MA) If L, card(L) < c, is locally compact, locally countable and has (\*) then L is  $\sigma$ -discrete (and thus Gruenhage).

### Examples

- Kunen's compact S-space K is Gruenhage. In particular, C(K)\* admits a strictly convex dual norm.
- Ostaszewski's space O is scattered but does not have (\*), thus C(O)\* does not admit a strictly convex dual norm.
- Using CH or b = ℵ<sub>1</sub>, there exist compact non-Gruenhage spaces having (\*), and with cardinality ℵ<sub>1</sub>.

#### Proposition

(MA) If L, card(L) < c, is locally compact, locally countable and has (\*) then L is  $\sigma$ -discrete (and thus Gruenhage).

### **ZFC Example**

There exists a locally compact non-Gruenhage space D having a  $G_{\delta}$ -diagonal.

D is a 'duplicate'  $\Lambda \times \{-1, 1\}$ , where  $\Lambda$  is Kurepa's tree of injective functions

$$t: \alpha \longrightarrow \mathbb{N}$$

with ordinal domain and co-infinite range.

A Baire category argument can be used to show that *D* is non-Gruenhage.

#### **ZFC Example**

There exists a locally compact non-Gruenhage space D having a  $G_{\delta}$ -diagonal.

D is a 'duplicate'  $\Lambda \times \{-1,1\},$  where  $\Lambda$  is Kurepa's tree of injective functions

$$t: \alpha \longrightarrow \mathbb{N}$$

#### with ordinal domain and co-infinite range.

A Baire category argument can be used to show that *D* is non-Gruenhage.

with ordinal domain and co-infinite range.

A Baire category argument can be used to show that *D* is non-Gruenhage.

## **Problems**

#### **Problems**

- If K has (\*) then does  $C(K)^*$  admit a strictly convex dual norm?
- In particular, what if  $K = L \cup \{\infty\}$ , where L has a  $G_{\delta}$ -diagonal?
- If  $(B_{X^*}, w^*)$  has (\*), does  $X^*$  admit a strictly convex dual norm?
- Is (\*) preserved by continuous images of compact spaces, or
